

CV Scaling and Lin/Exp control 1

Flexible input levels with the use of two knobs:
10Vpp
0V to 5V
0V to 10V

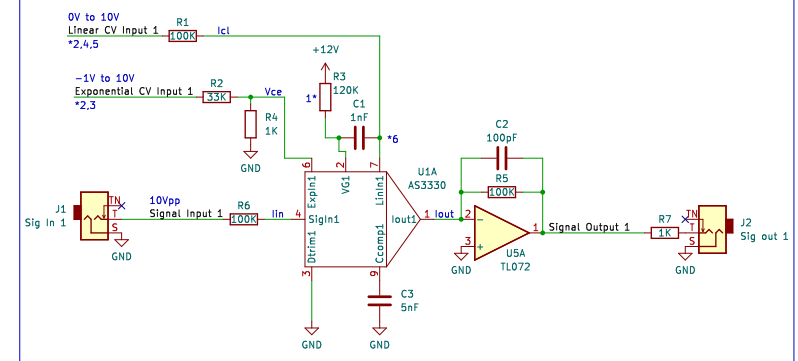

CV Scaling and Lin/Exp control 2

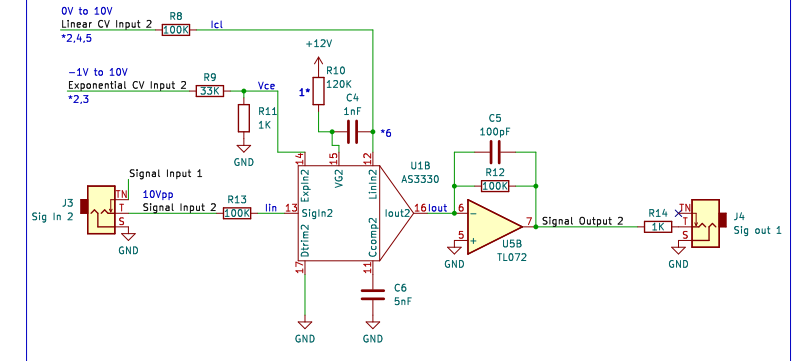

Flexible input levels with the use of two knobs:
10Vpp
0V to 5V
0V to 10V

VCA 1

VCA 2

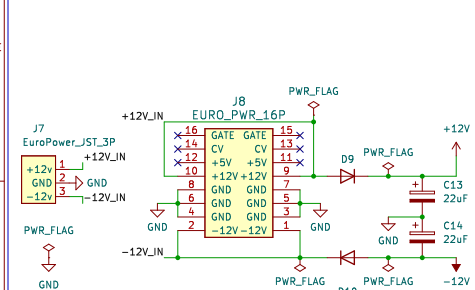

* NOTES *

- 1) RB should be 120K for a 100uA reference current
- 2) CV inputs must be normalised to VCC (Digisound)
- 3) Exp input should be inverted (Digisound)
- 4) Lin input is a summing node
- 5) a -10V input would fully attenuate the signal
- 6) 1nF or larger
- 7) @15V, 680R, 22mA
- 8) @12V, 560R, 21.4mA
- 9) IDLE, @68K, Class A

Control inputs (single input/either or):
Linear (Exp input must be at 0V or unity gain):
- 10V at the linear CV input through the 100K resistor will be at unity gain.
- 0V would be max attenuation.
Exponential (Linear input must be at 10V or unity gain):
- 0V at the exponential CV input through the 33K resistor will be at unity gain.
- 10V would be max attenuation.

Power

3330 power and idle

Op amp power and decoupling

This version is a prototype
