

## CV Scaling and Lin/Exp control 1

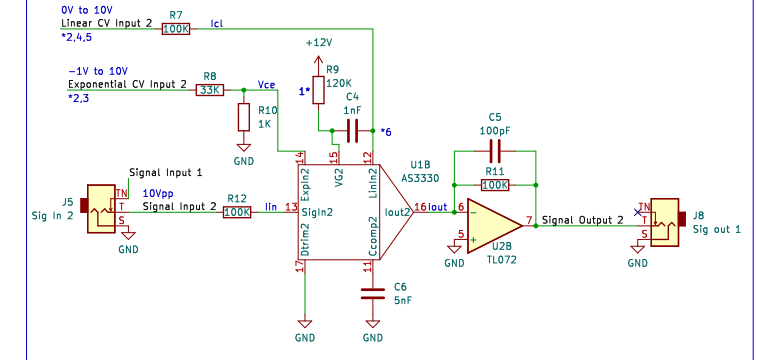

## VCA 1

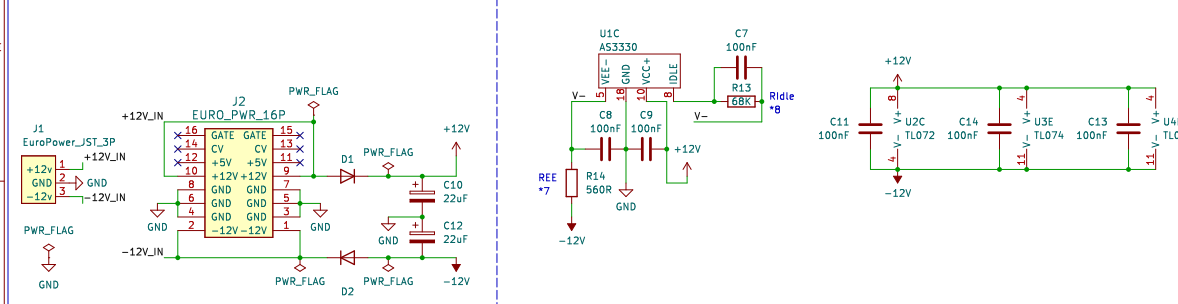

## CV Scaling and Lin/Exp control 2

## VCA 2

## Power

## \* NOTES \*

- 1) RB should be 120K for a 100uA reference current
- 2) CV inputs must be normalised to VCC (Digisound)
- 3) Exp input should be inverted (Digisound)
- 4) Lin input is a summing node
- 5) a -10V input would fully attenuate the signal
- 6) 1nF or larger
- 7) 0.15V, 680R, 22mA
- 8) 0.12V, 560R, 21.4mA
- 9) IDLE, 0.68K, Class A

Control inputs (single input/either or):  
Linear (Exp input must be at 0V or unity gain):  
- 10V at the linear CV input through the 100K resistor will be at unity gain.  
- 0V would be max attenuation.  
Exponential (Linear input must be at 10V or unity gain):  
- 0V at the exponential CV input through the 33K resistor will be at unity gain.  
- 10V would be max attenuation.

This version is a prototype
